

Milestone 3 Progress:

- What features were completed?
 - We have completed the UI for the login, registration, home, search, ingredients filter, and drink creation pages. The website is able to be run through yarn and is linked to the database.
- What worked during the demo?
 - During the demo, the website ran through yarn and the login, registration, and home pages were all linked and functional. We also have several other pages that are not linked yet that have functional UI. We also had a working link to the database, though it only prints out the name of the database and some details about the database at the moment.
- What issues were faced either during the development or during the demo?
 - We had a lot of issues getting everyone's computers to work with all of the packages and the database. This was the reason that we switched from doing an app to creating a website, the app environment was not working on everyone's computers and we couldn't figure out why.
- What were the suggestions offered by the TA?
 - He suggested that we add the requirements for making an account through regex (like we did in the previous lab). He also suggested that we begin to connect our UI elements with the database that we have set up. Finally, he suggested that we look up some apis that we can use for our website (he didn't list any specific ones, just recommended we find some).
- Individual contributions by each team member
 - Charlotte:
 - Made the UI for the login page
 - Made the UI for the registration
 - John:
 - Made the database linked with the login and registration pages
 - Wrote backend functions for login functionality
 - Created the architecture diagram
 - Routed all the webpages with navbar
 - Kent:
 - Made the UI for search bar
 - Ashley
 - Made the UI for drink history page
 - Junyu
 - Made the UI for elect ingredients page
 - Jack

■ Made UI for the drink creation page
